Write the interactive Java class Project3 that asks the user to input their weight in lbs. as an integer and then prints a message accordning to this table:

Weight	Message
0 - 50	"Eat more."
50 - 100	"I hope you are short."
100 - 200	"Quite average."
200 - 300	"I hope you are tall."
300 - 500	"Into sumo?"
anything else	"You liar!"

There are many ways to write this program; use lecture comments to determine a good way. Notice you will have to deal with a boundary problem – does 50 lbs. go with the first message or the second message? Handle this in a consistent way.

Follow all style and documentation conventions. Turn in a listing of your source code, a sample run, and use this page as a cover sheet. Late assignments will not be accepted.

Options:

1. Include an opening and a goodbye message.
2. Make your message output fancy by putting a border around it.
